

# CHAPTER 1

## **INTRODUCTION**

An E-Business portal for connecting sellers to customers. It helps the sellers to grow the business by connecting to the customers in a very easy, smart way. Electronic Commerce is process of doing business through computer networks. A person sitting on his chair in front of a computer can access all the facilities of the Internet to buy or sell the products. Unlike traditional commerce that is carried out physically with effort of a person to go & get products, ecommerce has made it easier for human to reduce physical work and to save time.

For increasing the use of e-commerce in developing countries the B2B e-commerce is implemented for improving access to global markets for firms in developing countries. For a developing country advancement in the field of e-commerce is essential. The research strategy shows the importance of the e-commerce in developing countries for business applications.

## CHAPTER 2

### PROBLEM STATEMENT

When person wants to buy any product for example book he first have to drive to books store then walk throughout the store until he locates the book he need. After finding the product if he wants to purchase, he may often need to stand in long queue at cash counter for long time.

The online shopping is the best and convince way for shopping. Online shopping helps consumer avoid this disadvantage.

With the help of online shopping consumer can buy a variety of items from the online store. With the online shopping consumer can purchase just above any things from companies that provide online household appliances, books, clothing, toys, furniture and many more products.

## CHAPTER 3

### SYSTEM APPROACH

#### 3.1 MOTIVATION

##### 3.1 PHP:

PHP is a server-side scripting language designed for web development but also used as a general-purpose programming language. Originally created by [Rasmus Lerdorf](#) in 1994, the [reference implementation](#) of PHP (powered by the [Zend Engine](#)) is now produced by The PHP Group. While PHP originally stood for *Personal Home Page* it now stands for *PHP: HypertextPre-processor*, which is a [recursive backronym](#). PHP code can be simply mixed with [HTML](#) code, or it can be used in combination with various [templating engines](#) and [web frameworks](#). PHP code is usually processed by a PHP [interpreter](#), which is usually implemented as a web server's native [module](#) or a [Common Gateway Interface](#) (CGI) executable.

##### 3.2 CSS:

Cascading Style Sheets (CSS) is a style sheet language used for describing the look and formatting of a document written in a mark-up language. While most often used to change the style web pages and user interfaces written in HTML and XHTML, the language can be applied to any kind of XML document, including plain XML, SVG and XUL. CSS is a cornerstone specification of the web, and almost all web pages use CSS style sheets to describe their presentation.

CSS is designed primarily to enable the separation of document content from document presentation, including elements such as the layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple pages to share formatting, and reduce complexity and repetition in the structural content (such as by allowing for table less web design). It obviates those portions of mark-up that would specify presentation by instead providing that information in a separate file.

### **3.3 JAVASCRIPT:**

JavaScript is a dynamic computer programming language. It is most commonly used as part of web browsers, whose implementations allow client-side scripts to interact with the user, control the browser, communicate asynchronously, and alter the document content that is displayed. It is also being used in server-side network programming (with Node.js), game development and the creation of desktop and mobile applications.

JavaScript is classified as a prototype-based scripting language with dynamic typing and has first-class functions. This mix of features makes it a multi-paradigm language, supporting object-oriented, imperative, and functional programming styles.

Despite some naming, syntactic, and standard library similarities, JavaScript and Java are otherwise unrelated and have very different semantics.

## CHAPTER 4

### SYSTEM IMPLEMENTATION

The consumer moves through the internet to the merchant's web site. From there, he decides that he wants to purchase something, so he is moved to the online transaction server, where all of the information he gives is encrypted. Once he has placed his order, the information moves through a private gateway to a Processing Network, where the issuing and acquiring banks complete or deny the transaction. This generally takes place in no more than 5-7seconds.

Online shopping is aimed towards the vendors who want to reach out to the maximum cross-section of customers and common people who can be potential customer. This study envisages bridging the gap between the sellers.

The retailer and the customer. OS is user-friendly, quick to learn and reliable software for thepurpose.

Grow your business with the leader in Indian e-commerce

### PRICING

We make the fastest payments in the industry. For every sale you make, you get paid within the next 7-14 business days. You decide the price of your products and we charge you a small fee on the successful orders you make.

### PRICING STRUCTURE

Here's an easy example, which illustrates a sample the above calculation:

ITEM	AMOUNT (RS.)
Selling Price (decided by you)	1000
Commission Fee (varies across sub-categories/verticals)	100(assuming 10%)
Shipping Fee (Local shipping , weight 0-500 grams)	30
Collection Fee (2.5 % on the Order item value or Rs 20 whichever is higher)	25
Fixed Fee	30
Total Marketplace Fee	185
Service Tax (15% of Marketplace Fee including Swachh Bharat & Krishi Kalyan cess)	27.75
<b>Total deductions</b>	<b>212.75</b>
<b>Settlement Value</b>	<b>787.25</b>

### SELL ON CATALOG

Catalog marketplace is India's leading platform for selling online. Be it a manufacturer, vendor or supplier, simply sell your products online on Catalog and become a top e-commerce player with minimum investment. Through a team of experts offering exclusive seller workshops, training, seller support and convenient seller portal, Catalog focuses on educating and empowering sellers across India.

Selling on Catalog.com is easy and absolutely free. All you need is to register, list your catalogue and start selling your products.

What's more! We have third party 'E-commerce Service Providers' who provide logistics, cataloging support, product photo shoot and packaging materials. We have Seller Protection Program to safeguard sellers from losses via compensation from Seller Protection Fund (SPF). We provide Catalog Advantage services through which you can ensure faster delivery of your items, quality check by our experts and delightful packaging. Combine these with fastest payments in the industry and an excellent seller portal. No wonder Catalog is India's favourite place to sell online.
